

Explosion-proof fan model for energy storage cabinet

Do you need an explosion proof fan or blower?

A fan or blower for a hazardous location, often called an explosion proof fan, may be required where flammable or combustible materials are in the atmosphere or being conveyed.

Does a lithium-ion energy storage unit need explosion control?

To address the safety issues associated with lithium-ion energy storage, NFPA 855 and several other fire codes require any BESS the size of a small ISO container or larger to be provided with some form of explosion control. This includes walk-in units, cabinet style BESS and buildings.

Can CFD be used to design an explosion prevention system?

CFD methodology can be extended to design an explosion prevention system for any ESS enclosure. Results can also provide the controlled release rate of flammable and toxic materials which is useful information for first responders and to assess environmental impacts.

Can explosion prevention systems mitigate gas concentrations according to NFPA 69 standards?

Simulations are often preferred to determine if an explosion prevention system can effectively mitigate gas concentrations according to NFPA 69 standards. CFD methodology can assist with the performance-based design of explosion prevention systems containing exhaust systems.

How to design a Bess explosion prevention system?

The critical challenge in designing an explosion prevention system for a BESS is to quantify the source term that can describe the release of battery gas during a thermal runaway event. Hence, full-scale fire test data such as from UL 9540A testing are important inputs for the gas release model.

What causes fire & explosion inside a Bess enclosure?

The leading cause of fire and explosion inside a BESS enclosure is the release and ignition of combustible vapors from an overheating battery.
