Overview Roles in the power grid Forms Economics See also External links Any electrical power grid must match electricity production to consumption, both of which vary significantly over time. Energy derived from solar and wind sources varies with the weather on time scales ranging from less than a second to weeks or longer. Nuclear power is less flexible than fossil fuels, meaning it cannot easily match the variations in demand. Thus, low-carbon electricity in the absence of storage present special challenges to electric utilities.

In addition, the combination of different energy storage systems are useful for storing and controlling the power, for use at the time of need [7]. McKinsey refers battery ...
