

Photovoltaic inverter heat dissipation installation requirements

Can a SolarEdge inverter be installed outside?

SolarEdge inverters can be installed indoors or outdoors, side by side, one above the other, or in a diagonal layout. To allow proper heat dissipation and prevent power reduction due to excessive temperature, ensure sufficient air circulation and maintain minimum clearance areas between the inverter and other objects, as described in this document.

What temperature should a solar inverter be installed in?

Ensure the inverter is out of children's reach. The ambient temperature should be between -30°C to 60°C . The humidity of the installation location should be below 100% without condensation. Do not install the inverter outdoors in salt, sulfur or other corrosive areas.

How do I choose the right inverter?

Make sure of correct string polarity. Make sure the mounting surface or structure can support the weight of the inverter. To allow proper heat dissipation, maintain minimum clearance areas between the inverter and other objects. The specification can be found in the quick guide supplied with the inverter.

How should a solar inverter be installed?

The humidity of the installation location should be below 100% without condensation. Do not install the inverter outdoors in salt, sulfur or other corrosive areas. Prevent the inverter from direct exposure to sun, rain and snow. The inverter should be well ventilated. Ensure air circulation. Never install the inverter in living areas.

How to plan a PV installation?

When planning an installation, verify the compatibility between the selected PV modules, power optimizers, inverters and other items installed. You can use datasheets to ensure specifications are correct. It is essential to plan the site's communications before the installation.

How to install a PV inverter?

step 1: Rotate all the DC switches to "OFF" position. step 2: Check the cable connection of the PV string for polarity correctness and ensure that the open circuit voltage in any case does not exceed the inverter input limit of 1,100V. step 3: Connect the PV connectors to corresponding terminals until there is an audible click.

To allow proper heat dissipation, maintain a $1\frac{1}{2}$ cm clearance distance between the power optimizer and other surfaces. Attach each power optimizer to the rack using the $\frac{5}{16}$ " or $\frac{1}{4}$ " ...
