

How does microgrid connection affect transient stability of power grid?

When the penetration rate of the microgrid is large, however a large amount of power is injected into the large grid, which causes the energy flow of the branch to increase, thereby increasing network losses. Impact of microgrid connection on the transient stability of the power grid

Can microgrids cause grid voltage fluctuations?

The continuous change of the output power of wind turbines and photovoltaic cells in the microgrid will lead to real-time changes in the penetration rate of the microgrid and fluctuations in the grid voltage. In addition, the introduction of microgrids will introduce power harmonics and can also cause grid voltage fluctuations.

What is the future development direction of microgrids in China?

The future development direction of microgrids in China will therefore be towards an energy system that integrates electricity, gas, water, and heat resources, achieves mutual coupling, and solves the problems of efficient energy utilization and peak regulation.

Can GCN be used for parameter identification of power grid branch?

To some extent, the parameter identification of power grid branch can be regarded as a special task of graph node classification, except that the task type has changed from classification to regression. Some recent methods show that GCN has great potential in parameter identification task.

What are the different types of microgrid projects in China?

In China, the microgrid projects that have been completed can be divided into island microgrids, remote areas microgrids, and urban area microgrids based on their geographic locations.

How to solve power grid parameter identification task in U-block?

For the power grid parameter identification task that we want to solve, we divide it into encoder and decoder in U-block. In the encoder part, we have two layers of down-sampling, each of which is composed of a graph pooling layer and a TAGConv layer. In the graph pooling layer, we keep the first 50% of nodes in every sampling.
