

Solar power generation and rainwater collection model

Does photovoltaic panel rainwater harvesting improve water-energy-food nexus in semi-arid areas?

Volume 896,20 October 2023,164938 The proposed model improves the water-energy-food (WEF) nexus in semi-arid areas. The photovoltaic panel rainwater harvesting (PVRH) system is considered in WEF nexus. The resource development potential of the PVRH system is evaluated. The increased resources tend to be allocated to economically efficient crops.

What is integrated rainwater harvesting system?

An integrated rainwater harvesting system is proposed to address three pressing issues (renewable power generation, drinking water scarcity, and environmental pollution) of the present world. The arrangement is a standalone system that generates electricity from the dropping effect and flowing properties of rainwater.

Can a PV panel rainwater harvesting system be used in semi-arid areas?

It is noteworthy that the use of PV panels has the advantages of large catchment areas, no infiltration and high storage rate, providing an ideal place and medium for rainwater harvesting in semi-arid areas. Based on this, a PV panel rainwater harvesting system has been designed.

Can solar power plants be used in rain harvesting?

By making use of this study data, annual reports of water usage statistics of the people of the region and annual rainwater harvest amount can be created, so that the availability of solar power plants in rain harvesting will be revealed and total reserve calculations in Turkey and the world can be made.

What is the storage capacity of a rainwater harvesting system?

The storage capacity of a rainwater harvesting system varies depending on rain amount and water consumption. In the first attempt pilot study, the rainwater harvesting system has a 1 m³ tank. In the second attempt pilot study, a system with a tank capacity of 25 m³ was installed. In addition, a 5.5 kW booster was added to the system.

Where is rainwater collected in a power plant?

Rainwater collected from PV arrays in the upper part of the power plant is collected in storage tanks in the lower part of the power plant for use for PV cleaning and irrigation when necessary.
