

The function of explosion-proof exhaust fan in energy storage cabinet

Can a mechanical exhaust ventilation system prevent explosions in Li-ion-based stationary battery energy storage systems?

This work developed a performance-based methodology to design a mechanical exhaust ventilation system for explosion prevention in Li-Ion-based stationary battery energy storage systems (BESS).

Can a standard exhaust ventilation method be used to design an explosion prevention system?

This arrangement makes it difficult to use a standard exhaust ventilation methodology to design an explosion prevention system. An innovative approach is used to purge the battery gas from individual Powin Stacks(TM) and from the main enclosure during a thermal runaway event.

How can CFD be used in explosion prevention systems containing exhaust systems?

CFD methodology can assist with the performance-based design of explosion prevention systems containing exhaust systems. CFD is a simulation tool that produces predictions of fluid-flow phenomena based on the laws governing fluid motion (i.e., mass, momentum, and energy).

Can a CFD-based method be used to design an explosion prevention system?

Note that the work presented here did not consider the presence of a clean agent or an aerosol-based suppression system that may impact the performance of the detection system and the ventilation system. In general, a CFD-based methodology can be effectively used with the performance-based design of an explosion prevention system.

Can explosion prevention system remove battery gas from the enclosure?

The evolution of battery gas in Fig. 13, Fig. 14 shows that the explosion prevention system can remove the battery gas from the enclosure. The 3D contours of battery gas can also help identify local spots where battery gas can concentrate.

Can a mechanical exhaust ventilation/purge system reduce flammable battery gas?

To achieve this criterion, a mechanical exhaust ventilation/purge system is typically used to remove flammable battery gas from the ESS space and replace it with clean air through intake louvers. Simulations are often preferred to determine if an explosion prevention system can effectively mitigate gas concentrations according to NFPA 69 standards.
